FIDO Metadata Service

FIDO Alliance Proposed Standard 27 September 2017

This version:
https://fidoalliance.org/specs/fido-v2.0-ps-20170927/fido-metadata-service-v2.0-ps-20170927.html
Previous version:
https://fidoalliance.org/specs/fido-v2.0-rd-20161004/fido-metadata-service-v2.0-rd-20161004.html
Editor:
Rolf Lindemann, Nok Nok Labs, Inc.

Brad Hill, PayPal, Inc.
Davit Baghdasaryan, Nok Nok Labs, Inc.

The English version of this specification is the only normative version. Non-normative translations may also be available.

Abstract

The FIDO Authenticator Metadata Specification defines so-called "Authenticator Metadata" statements. The metadata statements contain the "Trust Anchor" required to validate the attestation object, and they also describe several other important characteristics of the authenticator.

The metadata service described in this document defines a baseline method for relying parties to access the latest metadata statements.

Status of This Document

This section describes the status of this document at the time of its publication. Other documents may supersede this document. A list of current FIDO Alliance publications and the latest revision of this technical report can be found in the FIDO Alliance specifications index at https://www.fidoalliance.org/specifications/.

This document was published by the FIDO Alliance as a Proposed Standard. If you wish to make comments regarding this document, please Contact Us. All comments are welcome.

Implementation of certain elements of this Specification may require licenses under third party intellectual property rights, including without limitation, patent rights. The FIDO Alliance, Inc. and its Members and any other contributors to the Specification are not, and shall not be held, responsible in any manner for identifying or failing to identify any or all such third party intellectual property rights.

THIS FIDO ALLIANCE SPECIFICATION IS PROVIDED “AS IS” AND WITHOUT ANY WARRANTY OF ANY KIND, INCLUDING, WITHOUT LIMITATION, ANY EXPRESS OR IMPLIED WARRANTY OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

This document has been reviewed by FIDO Aliance Members and is endorsed as a Proposed Standard. It is a stable document and may be used as reference material or cited from another document. FIDO Alliance's role in making the Recommendation is to draw attention to the specification and to promote its widespread deployment.

Table of Contents

1. Notation

Type names, attribute names and element names are written as`code`.

String literals are enclosed in “”, e.g. “UAF-TLV”.

In formulas we use “|” to denote byte wise concatenation operations.

The notation `base64url(byte[8..64])` reads as 8-64 bytes of data encoded in base64url, "Base 64 Encoding with URL and Filename Safe Alphabet" [RFC4648] *without padding*.

Following [WebIDL-ED], dictionary members are optional unless they are explicitly marked as `required`.

WebIDL dictionary members must not have a value of null.

Unless otherwise specified, if a WebIDL dictionary member is DOMString, it must not be empty.

Unless otherwise specified, if a WebIDL dictionary member is a List, it must not be an empty list.

UAF specific terminology used in this document is defined in [FIDOGlossary].

All diagrams, examples, notes in this specification are non-normative.

> NOTE
>
> Note: Certain dictionary members need to be present in order to comply with FIDO requirements. Such members are marked in the WebIDL definitions found in this document, as `required`. The keyword `required` has been introduced by [WebIDL-ED], which is a work-in-progress. If you are using a WebIDL parser which implements [WebIDL], then you may remove the keyword `required` from your WebIDL and use other means to ensure those fields are present.

1.1 Key Words

The key words “must”, “must not”, “required”, “shall”, “shall not”, “should”, “should not”, “recommended”, “may”, and “optional” in this document are to be interpreted as described in [RFC2119].

2. Overview

This section is non-normative.

[FIDOMetadataStatement] defines authenticator metadata statements.

These metadata statements contain the trust anchor required to verify the attestation object (more specifically the

`KeyRegistrationData` object), and they also describe several other important characteristics of the authenticator, including supported authentication and registration assertion schemes, and key protection flags.

These characteristics can be used when defining policies about which authenticators are acceptable for registration or authentication.

The metadata service described in this document defines a baseline method for relying parties to access the latest metadata statements.

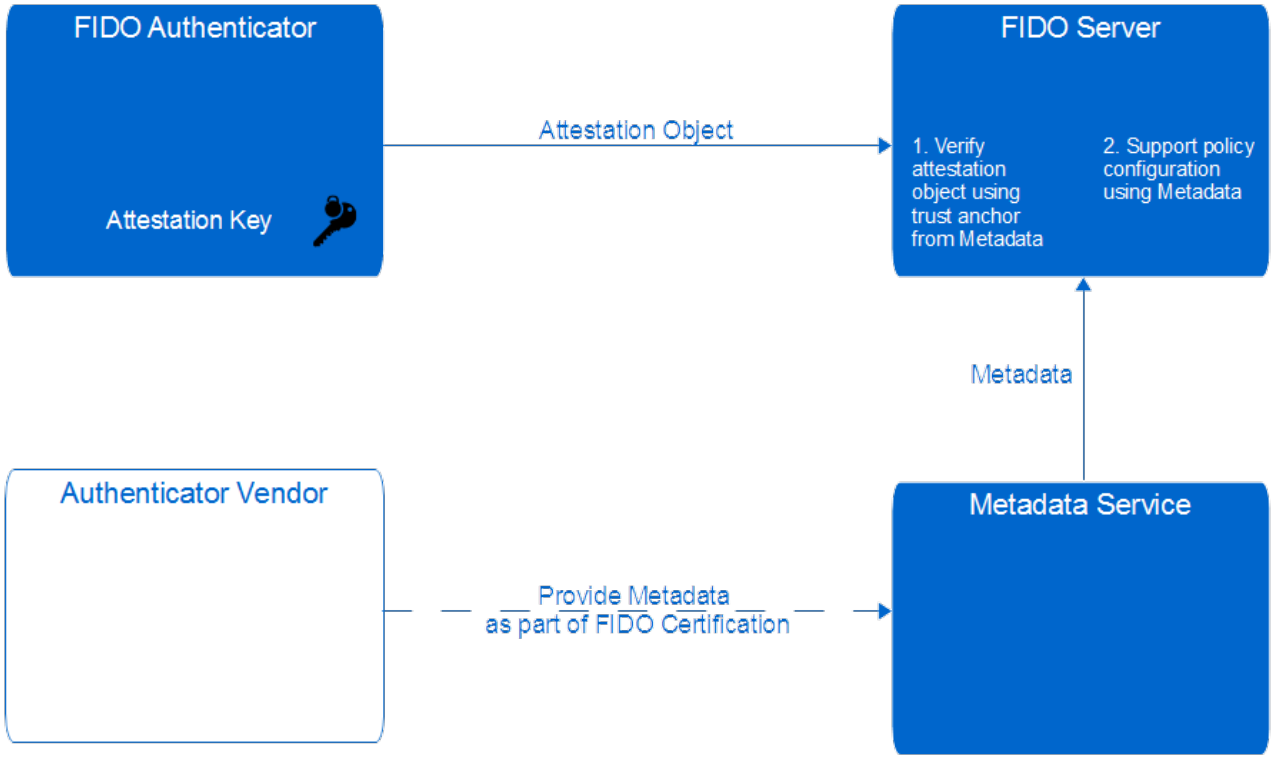

Fig. 1 FIDO Metadata Service Architecture Overview

2.1 Scope

This document describes the FIDO Metadata Service architecture in detail and it defines the structure and interface to access this service. It also defines the flow of the metadata related messages and presents the rationale behind the design choices.

2.2 Detailed Architecture

The metadata "table-of-contents" (TOC) file contains a list of metadata statements related to the authenticators known to the FIDO Alliance (FIDO Authenticators).

The FIDO Server downloads the metadata TOC file from a well-known FIDO URL and caches it locally.

The FIDO Server verifies the integrity and authenticity of this metadata TOC file using the digital signature. It then iterates through the individual entries and loads the metadata statements related to authenticator AAIDs relevant to the relying party.

Individual metadata statements will be downloaded from the URL specified in the entry of the metadata TOC file, and may be cached by the FIDO Server as required.

The integrity of the metadata statements will be verified by the FIDO Server using the hash value included in the related entry of the metadata TOC file.

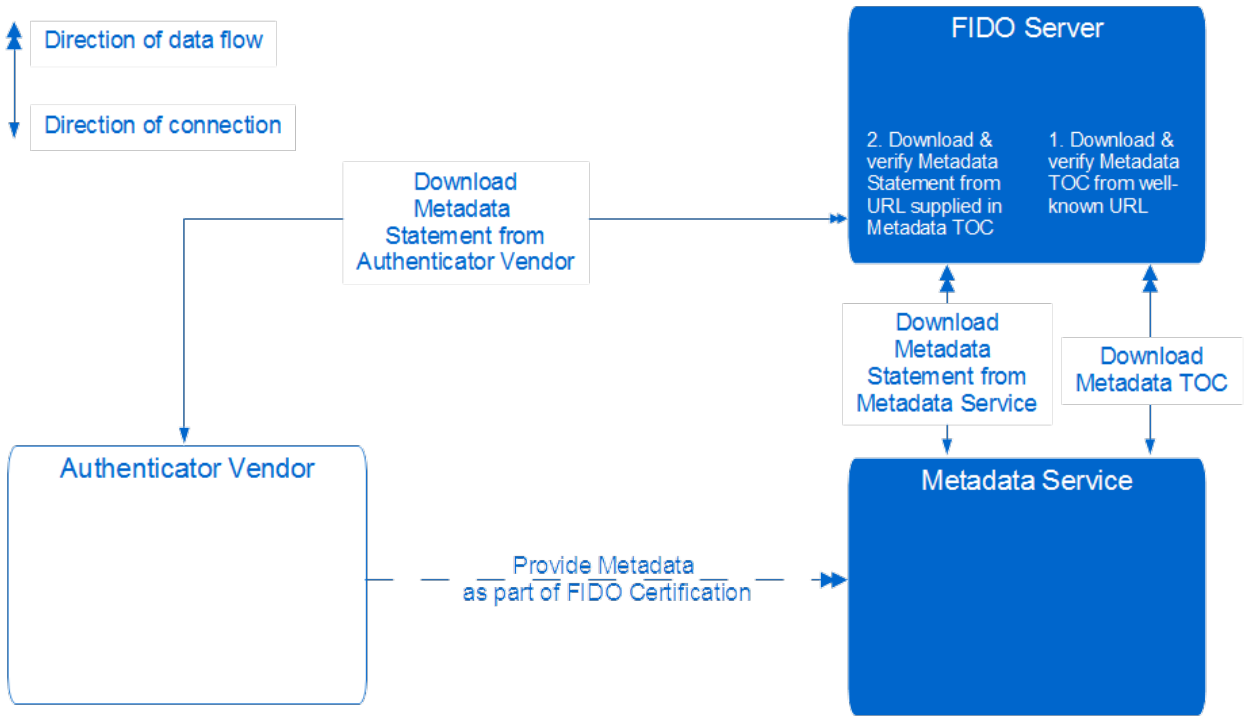

Fig. 2 FIDO Metadata Service Architecture

> NOTE
>
> The single arrow indicates the direction of the network connection, the double arrow indicates the direction of the data flow.

> NOTE
>
> The metadata TOC file is accessible at a well-known URL published by the FIDO Alliance.

> NOTE
>
> The relying party decides how frequently the metadata service is accessed to check for metadata TOC updates.

3. Metadata Service Details

This section is normative.

> NOTE
>
> The relying party can decide whether it wants to use the metadata service and whether or not it wants to accept certain authenticators for registration or authentication.

The relying party could also obtain metadata directly from authenticator vendors or other trusted sources.

3.1 Metadata TOC Format

> NOTE
>
> The metadata service makes the metadata TOC object (see Metadata TOC) accessible to FIDO Servers.
>
> This object is a "table-of-contents" for metadata, as it includes the AAID, the download URL and the hash value of the individual metadata statements. The TOC object contains one signature.

3.1.1 Metadata TOC Payload Entry dictionary

Represents the MetadataTOCPayloadEntry

WebIDL

```
dictionary MetadataTOCPayloadEntry {
    AAID                    aaid;
    AAGUID                  aaguid;
    DOMString[]             attestationCertificateKeyIdentifiers;
    DOMString               hash;
    DOMString               url;
    required StatusReport[] statusReports;
    required DOMString      timeOfLastStatusChange;
    DOMString               rogueListURL;
    DOMString               rogueListHash;
};
```

3.1.1.1 Dictionary `MetadataTOCPayloadEntry` Members

`aaid` of type AAID
: The AAID of the authenticator this metadata TOC payload entry relates to. See [UAFProtocol] for the definition of the AAID structure. This field must be set if the authenticator implements FIDO UAF.

> NOTE
>
> FIDO UAF authenticators support AAID, but they don't support AAGUID.

`aaguid` of type AAGUID
: The Authenticator Attestation GUID. See [FIDOKeyAttestation] for the definition of the AAGUID structure. This field must be set if the authenticator implements FIDO 2.

> NOTE
>
> FIDO 2 authenticators support AAGUID, but they don't support AAID.

`attestationCertificateKeyIdentifiers` of type array of DOMString
: A list of the attestation certificate public key identifiers encoded as hex string. This value must be calculated according to method 1 for computing the keyIdentifier as defined in [RFC5280] section 4.2.1.2. The hex string must not contain any non-hex characters (e.g. spaces). All hex letters must be lower case. This field must be set if neither `aaid` nor `aaguid` are set. Setting this field implies that the attestation certificate(s) are dedicated to a single authenticator model.

> NOTE
>
> FIDO U2F authenticators do not support AAID nor AAGUID, but they use attestation certificates dedicated to a single authenticator model.

`hash` of type DOMString
: `base64url(string[1..512])`

  The hash value computed over the base64url encoding of the UTF-8 representation of the JSON encoded metadata statement available at `url` and as defined in [FIDOMetadataStatement]. The hash algorithm related to the signature algorithm specified in the JWTHeader (see Metadata TOC) must be used.

  If this field is missing, the metadata statement has not been published.

> NOTE
>
> This method of base64url encoding the UTF-8 representation is also used by JWT [JWT] to avoid encoding ambiguities.

`url` of type DOMString
: Uniform resource locator (URL) of the encoded metadata statement for this authenticator model (identified by its AAID, AAGUID or attestationCertificateKeyIdentifier). This URL must point to the base64url encoding of the UTF-8 representation of the JSON encoded metadata statement as defined in [FIDOMetadataStatement].

If this field is missing, the metadata statement has not been published.

```
encodedMetadataStatement = base64url(utf8(JSONMetadataStatement))
```

> NOTE
>
> This method of the base64url encoding the UTF-8 representation is also used by JWT [JWT] to avoid encoding ambiguities.

`statusReports` of type array of required StatusReport
An array of status reports applicable to this authenticator.

`timeOfLastStatusChange` of type required DOMString
ISO-8601 formatted date since when the status report array was set to the current value.

`rogueListURL` of type DOMString
URL of a list of rogue (i.e. untrusted) individual authenticators.

`rogueListHash` of type DOMString
`base64url(string[1..512])`

The hash value computed over the Base64url encoding of the UTF-8 representation of the JSON encoded rogueList available at `rogueListURL` (with type rogueListEntry[]). The hash algorithm related to the signature algorithm specified in the JWTHeader (see Metadata TOC) must be used.

This hash value must be present and non-empty whenever `rogueListURL` is present.

> NOTE
>
> This method of base64url-encoding the UTF-8 representation is also used by JWT [JWT] to avoid encoding ambiguities.

EXAMPLE 1: UAF Metadata TOC Payload

```
{ "no": 1234, "nextUpdate": "2014-03-31",
  "entries": [
   { "aaid": "1234#5678",
     "hash": "90da8da6de23248abb34da0d4861f4b30a793e198a8d5baa7f98f260db71acd4",
     "url": "https://fidoalliance.org/metadata/1234%x23abcd",
     "rogueListHash": "b5079cf40fd7ed174c645cc04df1e72b7f1229590585d16df62dd20b9541c6b5",
     "rogueListURL": "https://fidoalliance.org/metadata/1234%x23abcd.rl",
     "statusReports": [
                        { status: "FIDO_CERTIFIED", effectiveDate: "2014-01-04"}
                      ],
     "timeOfLastStatusChange": "2014-01-04"
     },
   { "attestationCertificateKeyIdentifiers": ["7c0903708b87115b0b422def3138c3c864e44573"],
     "hash": "785d16df640fd7b50ed174cb5645cc0f1e72b7f19cf22959052dd20b9541c64d",
     "url": "https://authnr-vendor-a.com/metadata/9876%x234321",
     "statusReports": [
                        { status: "FIDO_CERTIFIED", effectiveDate: "2014-01-07"},
                        { status: "UPDATE_AVAILABLE", effectiveDate: "2014-02-19",
                          url: "https://example.com/update1234" }
                      ],
     "timeOfLastStatusChange": "2014-02-19"
     }
  ]
}
```

> NOTE
>
> The character `#` is a reserved character and not allowed in URLs [RFC3986]. As a consequence it has been replaced by its hex value `%x23`.
>
> The authenticator vendors can decide to let the metadata service publish its metadata statements or to publish metadata statements themselves. Authenticator vendors can restrict access to the metadata statements they publish themselves.

3.1.2 StatusReport dictionary

> NOTE
>
> Contains an `AuthenticatorStatus` and additional data associated with it, if any.

New `StatusReport` entries will be added to report known issues present in firmware updates.

The latest `StatusReport` entry must reflect the "current" status. For example, if the latest entry has status `USER_VERIFICATION_BYPASS`, then it is recommended assuming an increased risk associated with all authenticators of this AAID; if the latest entry has status `UPDATE_AVAILABLE`, then the update is intended to address at least all previous issues *reported* in this StatusReport dictionary.

WebIDL

```
dictionary StatusReport {
    required AuthenticatorStatus status;
    DOMString                    effectiveDate;
    DOMString                    certificate;
    DOMString                    url;
    DOMString                    certificationDescriptor;
    DOMString                    certificateNumber;
    DOMString                    certificationPolicyVersion;
    DOMString                    certificationRequirementsVersion;
};
```

3.1.2.1 Dictionary `StatusReport` Members

`status` of type required AuthenticatorStatus
: Status of the authenticator. Additional fields may be set depending on this value.

`effectiveDate` of type DOMString
: ISO-8601 formatted date since when the status code was set, if applicable. If no date is given, the status is assumed to be effective while present.

`certificate` of type DOMString
: Base64-encoded [RFC4648] (not base64url!) DER [ITU-X690-2008] PKIX certificate value related to the current status, if applicable.

> NOTE
>
> As an example, this could be an Attestation Root Certificate (see [FIDOMetadataStatement]) related to a set of compromised authenticators (ATTESTATION_KEY_COMPROMISE).

`url` of type DOMString
: HTTPS URL where additional information may be found related to the current status, if applicable.

> NOTE
>
> For example a link to a web page describing an available firmware update in the case of status `UPDATE_AVAILABLE`, or a link to a description of an identified issue in the case of status `USER_VERIFICATION_BYPASS`.

`certificationDescriptor` of type DOMString
: Describes the externally visible aspects of the Authenticator Certification evaluation.

`certificateNumber` of type DOMString
: The unique identifier for the issued Certification

`certificationPolicyVersion` of type DOMString
: The version of the Authenticator Certification Policy the implementation is Certified to, e.g. "1.0.0".

`certificationRequirementsVersion` of type DOMString
: The version of the Authenticator Security Requirements the implementation is Certified to, e.g. "1.0.0".

3.1.3 AuthenticatorStatus enum

This enumeration describes the status of an authenticator model as identified by its AAID and potentially some additional information (such as a specific attestation key).

WebIDL

```
enum AuthenticatorStatus {
    "NOT_FIDO_CERTIFIED",
    "FIDO_CERTIFIED",
    "USER_VERIFICATION_BYPASS",
```

```
    "ATTESTATION_KEY_COMPROMISE",
    "USER_KEY_REMOTE_COMPROMISE",
    "USER_KEY_PHYSICAL_COMPROMISE",
    "UPDATE_AVAILABLE",
    "REVOKED",
    "SELF_ASSERTION_SUBMITTED",
    "FIDO_CERTIFIED_L1",
    "FIDO_CERTIFIED_L2",
    "FIDO_CERTIFIED_L3",
    "FIDO_CERTIFIED_L4",
    "FIDO_CERTIFIED_L5"
};
```

Enumeration description	
`NOT_FIDO_CERTIFIED`	This authenticator is not FIDO certified.
`FIDO_CERTIFIED`	This authenticator has passed FIDO functional certification. This certification scheme is phased out and will be replaced by FIDO_CERTIFIED_L1.
`USER_VERIFICATION_BYPASS`	Indicates that malware is able to bypass the user verification. This means that the authenticator could be used without the user's consent and potentially even without the user's knowledge.
`ATTESTATION_KEY_COMPROMISE`	Indicates that an attestation key for this authenticator is known to be compromised. Additional data should be supplied, including the key identifier and the date of compromise, if known.
`USER_KEY_REMOTE_COMPROMISE`	This authenticator has identified weaknesses that allow registered keys to be compromised and should not be trusted. This would include both, e.g. weak entropy that causes predictable keys to be generated or side channels that allow keys or signatures to be forged, guessed or extracted.
`USER_KEY_PHYSICAL_COMPROMISE`	This authenticator has known weaknesses in its key protection mechanism(s) that allow user keys to be extracted by an adversary in physical possession of the device.
`UPDATE_AVAILABLE`	A software or firmware update is available for the device. Additional data should be supplied including a URL where users can obtain an update and the date the update was published. When this code is used, then the field `authenticatorVersion` in the metadata Statement [FIDOMetadataStatement] must be updated, if the update fixes severe security issues, e.g. the ones reported by preceding StatusReport entries with status code `USER_VERIFICATION_BYPASS`, `ATTESTATION_KEY_COMPROMISE`, `USER_KEY_REMOTE_COMPROMISE`, `USER_KEY_PHYSICAL_COMPROMISE`, `REVOKED`. NOTE Relying parties might want to inform users about available firmware updates.
`REVOKED`	The FIDO Alliance has determined that this authenticator should not be trusted for any reason, for example if it is known to be a fraudulent product or contain a deliberate backdoor.
`SELF_ASSERTION_SUBMITTED`	The authenticator vendor has completed and submitted the self-certification checklist to the FIDO Alliance. If this completed checklist is publicly available, the URL will be specified in `StatusReport.url`.
`FIDO_CERTIFIED_L1`	The authenticator has passed FIDO Authenticator certification at level 1. This level is the more strict successor of FIDO_CERTIFIED.
`FIDO_CERTIFIED_L2`	The authenticator has passed FIDO Authenticator certification at level 2. This level is more strict than level 1.
`FIDO_CERTIFIED_L3`	The authenticator has passed FIDO Authenticator certification at level 3. This level is more strict than level 2.
`FIDO_CERTIFIED_L4`	The authenticator has passed FIDO Authenticator certification at level 4. This level is more strict than level 3.
`FIDO_CERTIFIED_L5`	The authenticator has passed FIDO Authenticator certification at level 5. This level is more strict than level 4.

More values might be added in the future. FIDO Servers must silently ignore all unknown AuthenticatorStatus values.

3.1.4 RogueListEntry dictionary

NOTE

Contains a list of individual authenticators known to be rogue.

New `RogueListEntry` entries will be added to report new individual authenticators known to be rogue.

Old `RogueListEntry` entries will be removed if the individual authenticator is known to not be rogue any longer.

WebIDL

```
dictionary RogueListEntry {
    required DOMString sk;
    required DOMString date;
};
```

3.1.4.1 Dictionary `RogueListEntry` Members

`sk` of type required DOMString
: Base64url encoding of the rogue authenticator's secret key (sk value, see [FIDOEcdaaAlgorithm], section ECDAA Attestation).

  NOTE

  In order to revoke an individual authenticator, its secret key (sk) must be known.

`date` of type required DOMString
: ISO-8601 formatted date since when this entry is effective.

EXAMPLE 2: RogueListEntry[] example

```
[
   { "sk": "30efa86aa6de25249acb35da0d4861f4b30a793e198a8d5baa7e96f240da51f3",
     "date": "2016-06-07"},
   { "sk": "93de8da6de23248abb34da0d4861f4b30a793e153a8d5bb27f98f260db71acd4",
     "date": "2016-06-09"},
]
```

3.1.5 Metadata TOC Payload dictionary

Represents the MetadataTOCPayload

WebIDL

```
dictionary MetadataTOCPayload {
    DOMString                          legalHeader;
    required Number                    no;
    required DOMString                 nextUpdate;
    required MetadataTOCPayloadEntry[] entries;
};
```

3.1.5.1 Dictionary `MetadataTOCPayload` Members

`legalHeader` of type DOMString
: The legalHeader, if present, contains a legal guide for accessing and using metadata, which itself may contain URL(s) pointing to further information, such as a full Terms and Conditions statement.

`no` of type required Number
: The serial number of this UAF Metadata TOC Payload. Serial numbers must be consecutive and strictly monotonic, i.e. the successor TOC will have a `no` value exactly incremented by one.

`nextUpdate` of type required DOMString
: ISO-8601 formatted date when the next update will be provided at latest.

`entries` of type array of required MetadataTOCPayloadEntry
: List of zero or more MetadataTOCPayloadEntry objects.

3.1.6 Metadata TOC

The metadata table of contents (TOC) is a JSON Web Token (see [JWT] and [JWS]).

It consists of three elements:

- The base64url encoding, without padding, of the UTF-8 encoded JWT Header (see example below),
- the base64url encoding, without padding, of the UTF-8 encoded UAF Metadata TOC Payload (see example at the beginning of section Metadata TOC Format),
- and the base64url-encoded, also without padding, JWS Signature [JWS] computed over the to-be-signed payload using the Metadata TOC signing key, i.e.

```
tbsPayload = EncodedJWTHeader | "." | EncodedMetadataTOCPayload
```

All three elements of the TOC are concatenated by a period ("."):

```
MetadataTOC = EncodedJWTHeader | "." | EncodedMetadataTOCPayload | "." | EncodedJWSSignature
```

The hash algorithm related to the signing algorithm specified in the JWT Header (e.g. SHA256 in the case of "ES256") must also be used to compute the hash of the metadata statements (see section Metadata TOC Payload Entry Dictionary).

3.1.6.1 Examples

This section is non-normative.

```

EXAMPLE 4: JWT Header

```
{"typ":"JWT",
 "alg":"ES256"
 "x5t#S256":"7231962210d2933ec993a77b4a7203898ab74cdf974ff02d2de3f1ec7cb9de68"}
```

In order to produce the tbsPayload, we first need the base64url-encoded (without padding) JWT Header:

EXAMPLE 5: Encoded JWT Header

```
eyJ0eXAiOiJKV1QiLAogImFsZyI6IkVTMjU2IiwKICJ4NXQjUzI1NiI6IjcyMzE5NjIyMTBkMjkz
M2VjOTkzYTc3YjRhNzIwMzg5OGFiNzRjZGY5NzRmZjAyZDJkZTNmMWVjN2NiOWRlNjgifQ
```

then we have to append a period (".") and the base64url encoding of the `EncodedMetadataTOCPayload` (taken from the example in section Metadata TOC Format):

EXAMPLE 6: tbsPayload

```
eyJ0eXAiOiJKV1QiLAogImFsZyI6IkVTMjU2IiwKICJ4NXQjUzI1NiI6IjcyMzE5NjIyMTBkMjkz
M2VjOTkzYTc3YjRhNzIwMzg5OGFiNzRjZGY5NzRmZjAyZDJkZTNmMWVjN2NiOWRlNjgifQ.

```

3.1.7 Metadata TOC object processing rules

The FIDO Server must follow these processing rules:

1. The FIDO Server must be able to download the latest metadata TOC object from the well-known URL, when appropriate. The `nextUpdate` field of the Metadata TOC specifies a date when the download should occur at latest.
2. If the `x5u` attribute is present in the JWT Header, then:
    1. The FIDO Server must verify that the URL specified by the `x5u` attribute has the same web-origin as the URL used to download the metadata TOC from. The FIDO Server should ignore the file if the web-origin differs (in order to prevent loading objects from arbitrary sites).
    2. The FIDO Server must download the certificate (chain) from the URL specified by the `x5u` attribute [JWS]. The certificate chain must be verified to properly chain to the metadata TOC signing trust anchor according to [RFC5280]. All certificates in the chain must be checked for revocation according to [RFC5280].
    3. The FIDO Server should ignore the file if the chain cannot be verified or if one of the chain certificates is revoked.
3. If the `x5u` attribute is missing, the chain should be retrieved from the `x5c` attribute. If that attribute is missing as well, Metadata TOC signing trust anchor is considered the TOC signing certificate chain.
4. Verify the signature of the Metadata TOC object using the TOC signing certificate chain (as determined by the steps above). The FIDO Server should ignore the file if the signature is invalid. It should also ignore the file if its number (`no`) is less or equal to the number of the last Metadata TOC object cached locally.
5. Write the verified object to a local cache as required.
6. Iterate through the individual entries (of type `MetadataTOCPayloadEntry`). For each entry:
    1. Ignore the entry if the AAID, AAGUID or attestationCertificateKeyIdentifiers is not relevant to the relying party (e.g. not acceptable by any policy)
    2. Download the metadata statement from the URL specified by the field `url`. Some authenticator vendors might require authentication in order to provide access to the data. Conforming FIDO Servers should support the HTTP Basic, and HTTP Digest authentication schemes, as defined in [RFC2617].
    3. Check whether the status report of the authenticator model has changed compared to the cached entry by looking at the fields `timeOfLastStatusChange` and `statusReport`. Update the status of the cached entry. It is up to the relying party to specify behavior for authenticators with status reports that indicate a lack of certification, or known security issues. However, the status `REVOKED` indicates significant security issues related to such authenticators.

        > NOTE
        >
        > Authenticators with an unacceptable status should be marked accordingly. This information is required for building registration and authentication policies included in the registration request and the authentication request [UAFProtocol].

    4. Compute the hash value of the (base64url encoding without padding of the UTF-8 encoded) metadata statement downloaded from the URL and verify the hash value to the hash specified in the field `hash` of the metadata TOC object. Ignore the downloaded metadata statement if the hash value doesn't match.
    5. Update the cached metadata statement according to the dowloaded one.

4. Considerations

This section is non-normative.

This section describes the key considerations for designing this metadata service.

Need for Authenticator Metadata When defining policies for acceptable authenticators, it is often better to describe the required authenticator characteristics in a generic way than to list individual authenticator AAIDs. The metadata statements provide such information. Authenticator metadata also provides the trust anchor required to verify attestation objects.

The metadata service provides a standardized method to access such metadata statements.

Integrity and Authenticity Metadata statements include information relevant for the security. Some business verticals might even have the need to document authenticator policies and trust anchors used for verifying attestation objects for auditing purposes.

It is important to have a strong method to verify and proof integrity and authenticity and the freshness of metadata statements. We are using a single digital signature to protect the integrity and authenticity of the Metadata TOC object and we protect the integrity and authenticity of the individual metadata statements by including their cryptographic hash values into the Metadata TOC object. This allows for flexible distribution of the metadata statements and the Metadata TOC object using standard content distribution networks.

Organizational Impact Authenticator vendors can delegate the publication of metadata statements to the metadata service in its entirety. Even if authenticator vendors choose to publish metadata statements themselves, the effort is very limited as the metadata statement can be published like a normal document on a website. The FIDO Alliance has control over the FIDO certification process and receives the metadata as part of that process anyway. With this

metadata service, the list of known authenticators needs to be updated, signed and published regularly. A single signature needs to be generated in order to protect the integrity and authenticity of the metadata TOC object.

Performance Impact Metadata TOC objects and metadata statements can be cached by the FIDO Server.

The update policy can be specified by the relying party.

The metadata TOC object includes a date for the next scheduled update. As a result there is *no additional impact* to the FIDO Server during FIDO Authentication or FIDO Registration operations.

Updating the Metadata TOC object and metadata statements can be performed asynchronously. This reduces the availability requirements for the metadata service and the load for the FIDO Server.

The metadata TOC object itself is relatively small as it does not contain the individual metadata statements. So downloading the metadata TOC object does not generate excessive data traffic.

Individual metadata statements are expected to change less frequently than the metadata TOC object. Only the modified metadata statements need be downloaded by the FIDO Server.

Non-public Metadata Statements Some authenticator vendors might want to provide access to metadata statements only to their subscribed customers.

They can publish the metadata statements on access protected URLs. The access URL and the cryptographic hash of the metadata statement is included in the metadata TOC object.

High Security Environments Some high security environments might only trust internal policy authorities. FIDO Servers in such environments could be restricted to use metadata TOC objects from a proprietary trusted source only. The metadata service is the baseline for most relying parties.

Extended Authenticator Information Some relying parties might want additional information about authenticators before accepting them. The policy configuration is under control of the relying party, so it is possible to only accept authenticators for which additional data is available and meets the requirements.
