7 **Contributors:**

8 **Abstract:**

9 This document analyzes the FIDO security. The analysis is performed on the basis of the FIDO
10 Universal Authentication Framework (UAF) specification and FIDO Universal 2nd Factor (U2F)
11 specifications as of the date of this publication.

12 **Status:**

13 This Specification has been prepared by FIDO Alliance, Inc. **This is a Review Draft**
14 **Specification and is not intended to be a basis for any implementations as the**
15 **Specification may change.** Permission is hereby granted to use the Specification
16 solely for the purpose of reviewing the Specification. No rights are granted to prepare
17 derivative works of this Specification. Entities seeking permission to reproduce portions
18 of this Specification for other uses must contact the FIDO Alliance to determine whether
19 an appropriate license for such use is available.

20 Implementation of certain elements of this Specification may require licenses under third
21 party intellectual property rights, including without limitation, patent rights. The FIDO Al-
22 liance, Inc. and its Members and any other contributors to the Specification are not, and
23 shall not be held, responsible in any manner for identifying or failing to identify any or all
24 such third party intellectual property rights.

25 THIS FIDO ALLIANCE SPECIFICATION IS PROVIDED "AS IS" AND WITHOUT ANY
26 WARRANTY OF ANY KIND, INCLUDING, WITHOUT LIMITATION, ANY EXPRESS OR
27 IMPLIED WARRANTY OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS
28 FOR A PARTICULAR PURPOSE.

30 1 Notation

31 Type names, attribute names and element names are written in *italics*.

32 String literals are enclosed in “”, e.g. “UAF-TLV”.

33 In formulas we use “|” to denote byte wise concatenation operations.

34 1.1 Key Words

35 The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”,
36 “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this doc-
37 ument are to be interpreted as described in [RFC2119].

38 2 Introduction

39 This document analyzes the security properties of the FIDO UAF and U2F families of
 40 protocols. Although a brief architectural summary is provided below, readers should fa-
 41 miliarize themselves with the the FIDO Glossary of Terms [FIDOGlossary] for definitions
 42 of terms used throughout. For technical details of various aspects of the architecture,
 43 readers should refer to the FIDO Alliance specifications in the Bibliography.

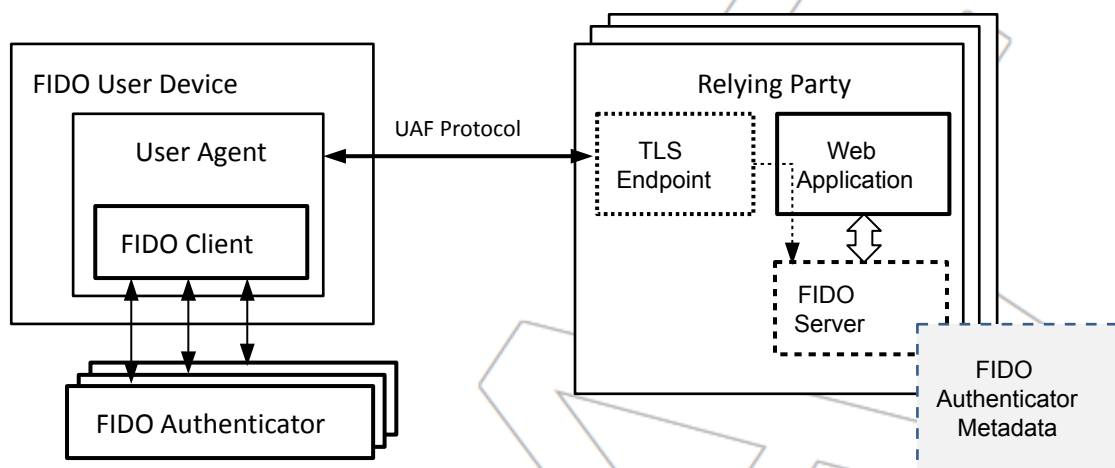

Illustration 1: Fido Reference Architecture

44 Conceptually, FIDO involves a conversation between a computing environment con-
 45 trolled by a Relying Party and one controlled by the user to be authenticated.

46 The Relying Party's environment consists conceptually of at least a web server and the
 47 server-side portions of a web application, plus a FIDO Server.

48 The FIDO Server has a trust store, containing the (public) trust anchors for the attesta-
 49 tion of FIDO Authenticators.

50 The user's environment, referred to as the FIDO user device, consists of one or more
 51 FIDO Authenticators, a piece of software called the FIDO Client that is the endpoint for
 52 UAF and U2F conversations, and User Agent software. The User Agent software may
 53 be a browser hosting a web application delivered by the Relying Party, or it may be a
 54 standalone application delivered by the Relying Party. In either case, the FIDO Client,
 55 while a conceptually distinct entity, may actually be implemented in whole or part within
 56 the boundaries of the User Agent.

57 **2.1 Intended Audience**

58 This document assumes a technical audience that is proficient with security analysis of
59 computing systems and network protocols as well as the specifics of the FIDO architec-
60 ture and protocol families. It discusses the security goals, security measures, security
61 assumptions and a series of threats to FIDO systems, including the user's computing
62 environment, the Relying Party's computing environment, and the supply chain, includ-
63 ing the vendors of FIDO components.

64 3 UAF Security Goals

65 In this section the specific security goals of UAF are described.

66 The UAF protocols supports a variety of different FIDO Authenticators. Even though the
67 security of those authenticators varies, the UAF protocol and the FIDO Server should
68 provide a very high level of security - at least on a conceptual level. In reality it might re-
69 quire a FIDO Authenticator with a high security level in order to fully leverage the UAF
70 security strength¹.

71 The U2F protocol supports a more constrained set of Authenticator capabilities. It
72 shares the same security goals as UAF, with the exception of [SG-14] Transaction Non-
73 Repudiation.

74 The UAF protocol has the following security goals²³:

75 [SG-1] **Strong User Authentication**: Authenticate (i.e. recognize) a user and/or a de-
76 vice to a relying party with high (cryptographic) strength.

77 [SG-2] **Credential Guessing Resilience**: Provide robust protection against eavesdrop-
78 pers, e.g. be *resilient to physical observation, resilient to targeted impersonation, re-*
79 *silient to throttled and unthrottled guessing*.

80 [SG-3] **Credential Disclosure Resilience**: Be *resilient to phishing attacks* and real-time
81 phishing attack, including resilience to online attacks by adversaries able to actively ma-
82 nipulate network traffic.

83 [SG-4] **Unlinkability**: Protect the protocol conversation such that any two relying parties
84 cannot link the conversation to one user (i.e. be *unlinkable*).

85 [SG-5] **Verifier Leak Resilience**: Be *resilient to leaks from other relying parties*. I.e.,
86 nothing that a verifier could possibly leak can help an attacker impersonate the user to
87 another relying party.

88 [SG-6] **Authenticator Leak Resilience**: Be resilient to leaks from other FIDO Authenti-
89 cators. I.e., nothing that a particular FIDO Authenticator could possibly leak can help an
90 attacker to impersonate any other user to any relying party.

91 [SG-7] **User Consent**: Notify the user before a relationship to a new relying party is be-
92 ing established (*requiring explicit consent*).

1 ¹In certain environments the overall security of the explicit authentication (provided by FIDO) is less important, as it
2 might be supplemented with a high degree of implicit authentication or the application doesn't even require a high
3 level of authentication strength.

4 ²For a definition of the phrases printed in italics, refer to the documents "[The Quest to Replace Passwords: A](#)
5 [Framework for Comparative Evaluation of Web Authentication Schemes](#)" and to "[Password Authentication](#)
6 [Schemes: Current Status and Key Issues](#)"

7 ³See "[Fast IDentity Online - Requirements, Draft](#)"

- 93 [SG-8] **Limited PII**: Limit the amount of personal identifiable information (PII) exposed
94 to the relying party to the absolute minimum.
- 95 [SG-9] **Attestable Properties**: Relying Party must be able to verify FIDO Authenticator
96 model/type (in order to calculate the associated risk).
- 97 [SG-10] **DoS Resistance**: Be resilient to *Denial of Service Attacks*. I.e. prevent attack-
98 ers from inserting invalid registration information for a legitimate user for the next login
99 phase. Afterward, the legitimate user will not be able to login successfully anymore.
- 100 [SG-11] **Forgery Resistance**: Be resilient to *Forgery Attacks (Impersonation Attacks)*.
101 I.e. prevent attackers from attempting to modify intercepted communications in order to
102 masquerade as the legitimate user and login to the system.
- 103 [SG-12] **Parallel Session Resistance**: Be resilient to *Parallel Session Attacks*. Without
104 knowing a user's authentication credential, an attacker can masquerade as the legiti-
105 mate user by creating a valid authentication message out of some eavesdropped com-
106 munication between the user and the server.
- 107 [SG-13] **Forwarding Resistance**: Be resilient to *Forwarding and Replay Attacks*. Hav-
108 ing intercepted previous communications, an attacker can impersonate the legal user to
109 authenticate to the system. The attacker can replay or forward the intercepted mes-
110 sages.
- 111 [SG-14] **Transaction Non-Repudiation**: Provide strong cryptographic non-repudiation
112 for secure transactions.
- 113 [SG-15] **Respect for Operating Environment Security Boundaries**: Ensure that reg-
114 istrations and key material as a shared system resource is appropriately protected ac-
115 cording to the operating environment privilege boundaries in place on the FIDO user de-
116 vice.

117 3.1 Assets to be Protected

- 118 Independent of any particular implementation, the UAF protocol assumes some assets
119 to be present and to be protected.
- 120 1) Cryptographic Authentication Key. Typically keys in FIDO are unique for each tu-
121 ple of (relying party, user account, authenticator).
 - 122 2) Cryptographic Authentication Key Reference. This is the cryptographic material
123 stored at the relying party and used to uniquely verify the Cryptographic Authenti-
124 cation Key, typically the public portion of an asymmetric key pair.
 - 125 3) Authenticator Attestation Key(as stored in each authenticator). This should only
126 be usable to attest a Cryptographic Authentication Key and the type and manu-
127 facturing batch of an Authenticator. Attestation keys and certificates are shared
128 by a large number of authenticators in a device class from a given vendor in or-
129 der to prevent their becoming a linkable identifier across relying parties. Authenti-

- 130 cator attestation certificates may be self-signed, or signed by an authority key
131 controlled by the vendor.
- 132 4) Authenticator Attestation Authority Key. An authenticator vendor may elect to
133 sign authenticator attestation certificates with a per-vendor certificate authority
134 key.
- 135 5) Authenticator Attestation Authority Certificate. Contained in the initial/default trust
136 store as part of the FIDO Server and contained in the active trust store main-
137 tained by each relying party.
- 138 6) Active Trust Store. Contains all trusted attestation master certificates for a given
139 FIDO server.
- 140 7) All data items suitable for uniquely identifying the authenticator across relying
141 parties. An attack on those would break the non-linkability security goal.
- 142 8) Private key of Relying Party TLS server certificate.
- 143 9) TLS root certificate trust store for the user's browser/app.

144 4 FIDO Security Measures

145 Note: Particular implementations of FIDO Clients, Authenticators, Servers and partici-
146 pating applications may not implement all of these security measures (e.g. **Secure Dis-**
147 **play**, [SM-10] **Transaction Confirmation**) and they also might (and should) implement
148 additional security measures.

149 The U2F protocol lacks support for [SM-5] **Secure Display**, [SM-10] **Transaction Con-**
150 **firmation**, has only server-supplied [SM-8] **Protocol Nonces**, and [SM-3] **Authentica-**
151 **tor Class Attestation** is implicit as there is only a single class of device.

152 [SM-1] **Key Protection**: Authentication key is protected against misuse. User unlocks
153 cryptographic authentication key stored in FIDO Authenticator (Except silent authentica-
154 tors).

155 [SM-2] **Unique Authentication Keys**: Cryptographic authentication key is specific and
156 unique to the tuple of (FIDO Authenticator, User, Relying Party).

157 [SM-3] **Authenticator Class Attestation**: Hardware-based FIDO Authenticators sup-
158 port authenticator attestation using a shared attestation certificate. Each relying party
159 receives regular updates of the trust store (through attestation service).

160 [SM-4] **Authenticator Status Checking**: Relying Parties will be notified of compro-
161 mised authenticators or authenticator attestation keys. The FIDO Server must take this
162 information into account. Authenticator manufacturers have to inform FIDO alliance
163 about compromised authenticators.

164 [SM-5] **User Consent**: FIDO Client implements a user interface for getting user's con-
165 sent on any actions (except authentication with silent authenticator) and displaying RP
166 name (derived from server URL).

167 [SM-6] **Cryptographically Secure Verifier Database**: The relying party stores only the
168 public portion of an asymmetric key pair, or an encrypted key handle, as an crypto-
169 graphic authentication key reference.

170 [SM-7] **Secure Channel with Server Authentication**: The TLS protocol with server au-
171 thentication or a transport with equivalent properties is used as transport protocol for
172 UAF. The use of https is enforced by a browser or Relying Party application.

173 [SM-8] **Protocol Nonces**: Both server and client supplied nonces are used for UAF reg-
174 istration and authentication.

175 [SM-9] **Authenticator Certification**: Only Authenticators meeting certification require-
176 ments defined by the FIDO Alliance and accurately describing their relevant characteris-
177 tics will have have their related attestation keys included in the default Trust Store.

178 [SM-10] **Transaction Confirmation (WYSIWYS)**: Secure Display (WYSIWYS) (option-
179 ally) implemented by the FIDO Authenticators is used by FIDO Client for displaying rely-
180 ing party name and transaction data to be confirmed by the user.

181 [SM-11] **Round Trip Integrity**: FIDO server verifies that the transaction data related to
 182 the server challenge received in the UAF message from the FIDO client is identical to
 183 the transaction data and server challenge delivered as part of the UAF request mes-
 184 sage.

185 [SM-12] **Channel Binding**: Relying Party servers may verify the continuity of a secure
 186 channel with a client application.

187 [SM-13] **Key Handle Access Token**: Authenticators not intended to roam between un-
 188 trusted systems are able to constrain the use of registration keys within the privilege
 189 boundaries defined by the operating environment of the user device. (per-user, or per-
 190 application, or per-user + per-application as appropriate)

191 [SM-14] **Trusted Facet List**: A Relying Party can declare the application identities al-
 192 lowed to access its registered keys, for operating environments on user devices that
 193 support this concept.

194 [SM-15] **Use Counters**: Authenticators send a monotonically increasing use counter
 195 that a Relying Party can check to possibly detect cloned authenticators.

196 **4.1 Relation between Measures and Goals**

Security Goal	Supporting Security Measures
[SG-1] Strong User Authentication	[SM-1] Key Protection [SM-12] Channel Binding [SM-14] Trusted Facet List [SM-15] Use Counters
[SG-2] Credential Guessing Resilience	[SM-1] Key Protection [SM-6] Cryptographically Secure Verifier Database
[SG-3] Credential Disclosure Resilience	[SM-1] Key Protection [SM-9] Authenticator Certification [SM-15] Use Counters
[SG-4] Unlinkability	[SM-2] Unique Authentication Keys
[SG-5] Verifier Leak Resilience	[SM-2] Unique Authentication Keys [SM-6] Cryptographically Secure Verifier Database
[SG-6] Authenticator Leak Resilience	[SM-9] Authenticator Certification

Security Goal	Supporting Security Measures
	[SM-15] Use Counters
[SG-7] User Consent	[SM-1] Key Protection [SM-5] User Consent [SM-7] Secure Channel with Server Authentication [SM-10] Transaction Confirmation (WYSIWYS)
[SG-8] Limited PII	[SM-2] Unique Authentication Keys
[SG-9] Attestable Properties	[SM-3] Authenticator Class Attestation [SM-4] Authenticator Status Checking [SM-9] Authenticator Certification
[SG-10] DoS Resistance	[SM-8] Protocol Nonces
[SG-11] Forgery Resistance	[SM-7] Secure Channel with Server Authentication [SM-8] Protocol Nonces [SM-11] Round Trip Integrity [SM-12] Channel Binding
[SG-12] Parallel Session Resistance	[SM-7] Secure Channel with Server Authentication [SM-8] Protocol Nonces [SM-11] Round Trip Integrity [SM-12] Channel Binding
[SG-13] Forwarding Resistance	[SM-7] Secure Channel with Server Authentication [SM-8] Protocol Nonces [SM-11] Round Trip Integrity [SM-12] Channel Binding
[SG-14] Transaction Non-Repudiation	[SM-1] Key Protection [SM-2] Unique Authentication Keys

Security Goal	Supporting Security Measures
	[SM-8] Protocol Nonces [SM-9] Authenticator Certification [SM-10] Transaction Confirmation (WYSI-WYS) [SM-11] Round Trip Integrity [SM-12] Channel Binding
[SG-15] Respect for Operating Environment Security Boundaries	[SM-13] Key Handle Access Token [SM-14] Trusted Facet List

197 **4.2 Minimum Requirements for FIDO Authenticators**

198 The FIDO Alliance, through its Certification Working Group, will publish minimum re-
 199 quirements for an Authenticator to be certified as FIDO-compliant, the type and nature
 200 of protection mechanisms to be attested to Relying Parties and a testing and compli-
 201 ance program for verifying such claims.

202 5 UAF Security Assumptions

203 Today's computer systems and cryptographic algorithms are not provably secure. In this
204 section we list the security assumptions, i.e. assumptions on security provided by other
205 components. A violation of any of these assumptions will prevent reliable achievement
206 of the Security Goals.

207 [SA-1] The cryptographic algorithms and parameters (key size, mode, output length,
208 etc.) in use are not subject to unknown weaknesses that make them unfit for their pur-
209 pose in encrypting, digitally signing, and authenticating messages.

210 [SA-2] Operating system privilege separation mechanisms relied up on by the software
211 modules involved in a FIDO operation on the user device perform as advertised. E.g.
212 boundaries between user and kernel mode, between user accounts, and between appli-
213 cations (where applicable) are securely enforced and security principals can be mutu-
214 ally, securely identifiable.

215 [SA-3] Applications on the user device are able to establish secure channels that pro-
216 vide trustworthy server authentication, and confidentiality and integrity for messages
217 (e.g., through TLS).

218 [SA-4] The secure display implementation is protected against spoofing and tampering.

219 [SA-5] The computing environment on the FIDO user device and the and applications
220 involved in a FIDO operation act as trustworthy agents of the user.

221 [SA-6] The inherent value of a cryptographic key resides in the confidence it imparts,
222 and this commodity decays with the passage of time, irrespective of any compromise
223 event. As a result the effective assurance level of authenticators will be reduced over
224 time.

225 [SA-7] The computing resources at the Relying Party involved in processing a FIDO op-
226 eration act as trustworthy agents of the Relying Party.

227 5.1 Discussion

228 With regard to [SA-5] and malicious computation on the FIDO user's device, only very
229 limited guarantees can be made within the scope of these assumptions. Malicious code
230 privileged at the level of the trusted computing base can always violate [SA-2] and [SA-
231 3]. Malicious code privileged at the level of the user's account in traditional multi-user
232 environments will also likely be able to violate [SA-3].

233 FIDO can also provide only limited protections when a user chooses to deliberately vio-
234 late [SA-5], e.g. by roaming a USB authenticator to an untrusted system like a kiosk, or
235 by granting permissions to access all authentication keys to a malicious app in a mobile
236 environment.

237 In to components such as the FIDO Client, Server, Authenticators and the mix of soft-
238 ware and hardware modules they are comprised of, the end-to-end security goals also
239 depend on correct implementation and adherence to FIDO security guidance by other
240 participating components, including web browsers and relying party applications. Some
241 configurations and uses may not be able to meet all security goals. For example, au-
242 thenticators may lack a secure display, they may be composed only of unattestable soft-
243 ware components, they may be deliberately designed to roam between untrusted oper-
244 ating environments, and some operating environments may not provide all necessary
245 security primitives (e.g., secure IPC, application isolation, modern TLS implementations,
246 etc.)

247 6 Threat Analysis

248 6.1 Threats to Client Side

249 6.1.1 Exploiting User's pattern matching weaknesses

250 [T-1.1.1]

251 The user is convinced to register a FIDO authentication key with a fraudulent
252 web site instead of the genuine Relying Party.

253 Consequences:

- 254 1. The fraudulent site may convince the user to disclose a set of non-FIDO creden-
255 tials sufficient to allow the attacker to register a FIDO Authenticator under its own
256 control, at the genuine Relying Party, on the user's behalf, violating [SG-1]
257 **Strong User Authentication.**

258 Mitigations:

- 259 1. Disclosure of non-FIDO credentials is outside of the scope of the FIDO security
260 measures, but Relying Parties should be aware that the initial strength of an au-
261 thentication key is no better than the identity-proofing applied as part of the regis-
262 tration process.

263 6.1.2 Threats to the User Device, FIDO Client and Relying Party Client Applica- 264 tions

265 [T-1.2.1]

266 Attacker gains ability to execute code in the security context of the FIDO Client.

267 Consequences:

- 268 1. Violation of [SA-5].

269 Mitigations:

- 270 1. When the operating environment on the FIDO user device allows, the FIDO
271 Client should operate in a privileged and isolated context under [SA-2] to protect
272 itself from malicious modification by anything outside of the Trusted Computing
273 Base.

274 [T-1.2.2]

275 Attacker gains physical access to the FIDO user device but not the FIDO Authen-
276 ticator.

277 Consequences:

- 278 1. Possible violation of [SA-5] by installing malicious software or otherwise tamper-
279 ing with the FIDO user device.

280 Mitigations:

- 281 1. [SM-1] **Key Protection** prevents the disclosure of authentication keys or other
282 assets during a transient compromise of the FIDO user device.
- 283 2. A persistent compromise of the FIDO user device can lead to a violation of [SA-5]
284 unless additional protection measures outside the scope of FIDO are applied to
285 the FIDO user device. (e.g. whole disk encryption and boot-chain integrity)

286 [T-1.2.3]

287 Attacker gains access to a user's login credentials on the FIDO user device.

288 Consequences:

- 289 1. Software-only authenticators might be remotely abused, or weakly-verifying au-
290 thenticators locally abused, violating [SG-1] **Strong User Authentication** and
291 [SG-13] **Transaction Non-Repudiation**.
- 292 2. Possible violation of [SA-5] by the installation of malicious software.

293 Mitigations:

- 294 1. Relying Parties can use [SM-9] **Authenticator Certification** and [SM-3] **Authen-
295 ticator Class Attestation** to determine the nature of authenticators and not rely
296 on weakly-verifying authenticators for high value operations.

297 [T-1.2.4]

298 A client application fails to properly validate the remote sever identity, accepts
299 forged or stolen credentials for a remote server, or allows weak or missing cryp-
300 tographic protections for the secure channel.

301 Consequences:

- 302 1. An active network adversary can modify the Relying Party's authenticator policy
303 and downgrade the client's choice of authenticator to make it easier to attack.
- 304 2. An active network adversary can intercept or view FIDO messages intended for
305 the Relying Party. It may be able to use this ability to violate [SG-12] **Parallel
306 Session Resistance**, [SG-11] **Forgery Resistance** or [SG-13] **Forwarding Re-
307 sistance**,

308 Mitigations:

- 309 1. The server can verify [SM-8] **Protocol Nonces** to detect replayed messages and
310 protect from an adversary that can read but not modify traffic in a secure chan-
311 nel.
- 312 2. The server can mandate a channel with strong cryptographic protections to pre-
313 vent message forgery and can verify a [SM-12] **Channel Binding** to detect for-
314 warded messages.

315 [T-1.2.5]

316 An attacker is able to obtain malicious execution in the security context of the Re-
317 lying Party application (e.g. via Cross-Site Scripting) or abuse the secure channel
318 or session identifier after the user has successfully authenticated.

319 Consequences:

- 320 1. The attacker is able to control the user's session, violating [SG-14] Transaction
321 **Non-Repudiation**.

322 Mitigations:

- 323 1. The server can employ [SM-10] **Transaction Confirmation** to gain additional as-
324 surance for high value operations.

325 [T-1.2.6]

326 A remote adversary is able to uniquely identify a FIDO user device using the fin-
327 gerprint of discoverable configuration of its FIDO Authenticators.

328 Consequences:

- 329 1. The exposed information violates [SG-8] **Limited PII**, allowing an adversary to vi-
330 olate [SG-7] **User Consent** by strongly authenticating the user without their
331 knowledge and [SG-4] **Unlinkability** by sharing that fingerprint.

332 Mitigations:

- 333 1. [SM-3] **Authenticator Class Attestation** ensures that the fingerprint of an Au-
334 thenticator will not be unique.
- 335 2. For web browsing situations where this threat is most prominent, user agents
336 may provide additional user controls around the discoverability of FIDO Authenti-
337 cators.

338 [T-1.2.7]

339 Malicious software on the FIDO user device is able to read, tamper with, or spoof
340 the endpoint of inter-process communication channels between the FIDO Client
341 and browser or Relying Party application.

342 Consequences:

343 1. Adversary is able to subvert [SA-2].

344 Mitigations:

345 1. On platforms where [SA-2] is not strong (e.g. implementing a FIDO Client as a
346 distinct app on iOS) the security of the system may depend on preventing mali-
347 cious applications from arriving on the FIDO user device. Such protections, e.g.
348 app store policing, are outside the scope of FIDO.

349 [T-1.2.8]

350 An adversary is able to obtain an authenticator's signed protocol response mes-
351 sage.

352 Consequences:

353 1. The attacker attempts to replay the message to authenticate as the user, violat-
354 ing [SG-1] **Strong User Authentication**, [SG-13] **Forwarding Resistance** and
355 [SG-12] **Parallel Session Resistance**.

356 Mitigations:

357 1. The server can use [SM-8] **Protocol Nonces** to detect replay of messages and
358 verify [SM-11] **Round Trip Integrity** to detect modified messages.

359 [T-1.2.9]

360 A user installs an application that represents itself as being associated with to
361 one Relying Party application but actually initiates a protocol conversation with a
362 different Relying Party and attempts to abuse previously registered authentica-
363 tion keys at that Relying Party.

364 Consequences:

365 1. Adversary is able to violate [SG-7] **User Consent** by misrepresenting the target
366 of authentication.
367 2. Other consequences equivalent to [T-1.2.5]

368 Mitigations:

369 1. If a [SM-5] **Secure Display** is present, the user may be able to verify the true tar-
370 get of an operation.
371 2. If the malicious application attempts to communicate directly with an Authentica-
372 tor that uses [SM-13] **API Keys**, it should not be able to access keys registered
373 by other FIDO Clients.
374 3. If the operating environment on the FIDO user device supports it, the FIDO client
375 may be able to determine the application's identity and verify if it is authorized to
376 target that Relying Party using a [SM-14] **Trusted Facet List**.

377 6.1.3 Creating a Fake FIDO Client

378 [T-1.3.1]

379 Attacker convinces users to install and use a malicious FIDO Client.

380 Consequences:

- 381 1. Violation of [SA-5]

382 Mitigations:

- 383 1. Mitigating malicious software installation is outside the scope of FIDO.
- 384 2. If an authenticator implements [SM-1] **Key Protection**, the user may be able to
- 385 recover full control of their registered authentication keys by removing the mali-
- 386 cious software from their user device.

387 6.1.4 Threats to FIDO Authenticator

388 [T-1.4.1]

389 Attacker convinces users to use a maliciously implemented authenticator.

390 Consequences:

- 391 1. The fake authenticator does not implement any appropriate security measures
- 392 and is able to violate all security goals of FIDO.

393 Mitigations:

- 394 1. A user may be unable to distinguish a malicious authenticator, but a Relying
- 395 Party can use [SM-3] **Authenticator Class Attestation** to identify and only allow
- 396 registration of reliable authenticators that have passed [SM-9] **Authenticator**
- 397 **Certification**
- 398 2. A Relying Party can additionally rely on [SM-4] **Authenticator Status Checking**
- 399 to check if an attestation presented by a malicious authenticator has been
- 400 marked as compromised.

401 [T-1.4.2]

402 Attacker attempts to extract a user's cryptographic authentication key for use in a

403 different context.

404 Consequences:

- 405 1. The attacker could impersonate the user with a cloned authenticator that does
- 406 not do trustworthy user verification, violating [SG-1].

407 Mitigations:

- 408 1. [SM-1] **Key Protection** measures are intended to prevent this.

- 409 2. Relying Parties can check [SM-9] **Authenticator Certification** attributes to de-
 410 termine the type of key protection in use by a given authenticator class.
- 411 3. Relying Parties can additionally verify the [SM-15] **User Counter** and detect that
 412 an authenticator has been cloned if it ever fails to advance relative to the prior
 413 operation.

414 [T-1.4.3]

415 Attacker could use the cryptographic authentication key (inside the authenticator)
 416 either with or without being noticed by the legitimate user.

417 Consequences:

- 418 1. Attacker could impersonate user, violating [SG-1].

419 Mitigations:

- 420 1. A user can only register and a Relying Party only allow authenticators that per-
 421 form [SM-1] **Key Protection** with an appropriately secure user verification
 422 process. (no silent authenticators)

423 [T-1.4.4]

424 Attacker could get physical access to FIDO Authenticator (e.g. by stealing it).

425 Consequences:

- 426 1. Attacker could launch offline attack in order to use the authentication key. If this
 427 offline attack succeeds, the attacker could successfully impersonate the user, vi-
 428 olating [SG-1] **Strong User Authentication**.
- 429 2. Attacker can introduce a low entropy situation to recover an ECDSA signature
 430 key, violating [SG-9] **Attestable Properties** if the attestation key is targeted or
 431 [SG-1] **Strong User Authentication** if a user key is targeted.

432 Mitigations:

- 433 1. [SM-1] **Key Protection** includes requirements to implement strong protections
 434 for key material, including resistance to offline attacks and low entropy situations.

435 [T-1.4.6]

436 Attacker is able to extract the authenticator attestation key from an authenticator,
 437 e.g. by neutralizing physical countermeasures in a laboratory setting.

438 Consequence:

- 439 1. Attacker can violate [SG-9] **Attestable Properties** by creating a malicious hard-
 440 ware or software device that represents itself as a legitimate one.

441 Mitigations:

442 1. Relying Parties can use [SM-4] **Authenticator Status Checking** to identify
443 known-compromised keys. Identification of such compromise is outside the strict
444 scope of the FIDO protocols.

445 [T-1.4.7]

446 Attacker is able to subvert [SM-5] **Secure Display** functionality (WYSIWYS), per-
447 haps by overlaying the display with false information.

448 Consequence:

449 1. Violation of [SG-14] **Transaction Non-Repudiation**

450 Mitigations:

- 451 1. Implementations must take care to protect [SA-4] in their implementation of a se-
452 cure display, e.g. by implementing a distinct hardware display or employing ap-
453 propriate privileges in the operating environment of the user device to protect
454 against spoofing and tampering.
- 455 2. [SM-9] **Authenticator Certification** will provide Relying Parties with metadata
456 about the nature of a secure display information that can be used to assess
457 whether it matches the assurance level and risk tolerance of the Relying Party for
458 that particular transaction.

459 [T-1.4.8]

460 A cryptographic attack is discovered against the public key encryption system
461 used to sign data by the FIDO authenticator.

462 Consequences:

463 1. Attacker is able to use messages generated by the client to violate [SG-2] **Cre-**
464 **dential Guessing Resistance**

465 Mitigations

- 466 1. [SM-8] **Protocol Nonces**, including client-generated entropy, limit the amount of
467 control any adversary has over the internal structure of an authenticator.
- 468 2. [SM-1] **Key Protection** for non-silent authenticators requires user interaction to
469 authorize any operation performed with the authentication key, severely limiting
470 the rate at which an adversary can perform adaptive cryptographic attacks.

471 6.2 Threats to Relying Party

472 6.2.1 Threats to FIDO Server Data

473 [T-2.1.1]

474 Attacker could obtain read-access to FIDO Server registration database.

475 Consequences:

- 476 1. Attacker can access all cryptographic key handles and authenticator characteristics associated with a username. If an authenticator or combination of authenticators is unique, they might use this to try to violate [SG-2] **Unlinkability**
- 477
- 478
- 479 2. Attacker attempts to perform factorization of public keys by virtue of having access to a large corpus of data, violating [SG-5] **Verifier Leak Resilience** and
- 480
- 481 [SG-2] **Credential Guessing Resilience**

482 Mitigations:

- 483 1. [SM-2] **Unique Authentication Keys** help prevent disclosed key material from
- 484 being useful against any other Relying Party, even if successfully attacked.
- 485 2. The use of an [SM-6] **Cryptographically Secure Verifier Database** helps assure that it is infeasible to attack any leaked verifier keys.
- 486
- 487 3. [SM-9] **Authenticator Certification** should help prevent authenticators with poor
- 488 entropy from entering the market, reducing the likelihood that even a large corpus
- 489 of key material will be useful in mounting attacks.

490 [T-2.1.2]

491 Attacker gains write-access to the FIDO Server registration database.

492 Consequences:

- 493 1. Violation of [SA-7]
- 494 2. The attacker may inject a key registration under its control, violating [SG-1]
- 495 **Strong User Authentication**

496 Mitigations:

- 497 1. Mitigating such attacks is outside the scope of FIDO. The Relying Party must
- 498 maintain the integrity of any information it relies up on to identify a user as part of
- 499 [SA-7].

500 [T-2.2.1]

501 Attacker gains ability to execute code in the security context of the Relying Party
502 web application or FIDO Server.

503 Consequence:

504 1. Attacker is able to violate [SG-1], [SG-10], [SG-9] and any other Relying Party
505 controls.

506 Mitigations:

507 1. The consequences of such an incident are limited to the relationship between the
508 user and that particular Relying Party by [SM-1], [SM-2], and [SM-5].

509 2. Even within the Relying Party to user relationship, a user can be protected by
510 [SM-10] **Transaction Confirmation** if the compromise does not include to the
511 user's computing environment.

512 6.3 Threats to the Secure Channel between Client and Relying Party

513 6.3.1 Exploiting Weaknesses in the Secure Transport of FIDO Messages

514 FIDO takes as a base assumption that [SA-3] applications on the user device are able
515 to establish secure channels that provide trustworthy server authentication, and confi-
516 dentiality and integrity for messages. e.g. through TLS. [T-1.2.4] Discusses some con-
517 sequences of violations of this assumption due to implementation errors in a browser or
518 client application, but other threats exist in different layers.

519 [T-3.1.1]

520 The FIDO user device is administratively to connect through a proxy that termi-
521 nates TLS connections. The client trusts this device, but the connection between
522 the user and FIDO server is no longer end-to-end secure.

523 Consequences:

524 1. Any such proxies introduce a new party into the protocol. If this party is untrust-
525 worthy, consequences may be as for [T-1.2.4]

526 Mitigations

527 1. Mitigations for [T-1.2.4] apply, except that the proxy is considered trusted by the
528 client, so certain methods of [SM-12] **Channel Binding** may indicate a compro-
529 mised channel even in the absence of an attack. Servers should use multiple
530 methods and adjust their risk scoring appropriately. A trustworthy client that re-
531 ports a server certificate that is unknown to the server and does not chain to a
532 public root may indicate a client behind such a proxy. A client reporting a server
533 certificate that is unknown to the server but validates for the server's identity ac-
534 cording to commonly used public trust roots is more likely to indicate [T-3.1.2]

535 [T-3.1.2]

536 An attacker is able to obtain control of a certificate credential for a Relying Party,
537 perhaps from a compromised Certification Authority or poor protection practices
538 by the Relying Party.

539 Consequences:

540 1. As for [T-1.2.4]

541 Mitigations:

542 1. As for [T-1.2.4]

543 6.4 Threats to the Infrastructure

544 6.4.1 Threats to FIDO Authenticator Manufacturers

545 [T-4.1.1]

546 Attacker obtains control of an attestation key or attestation key issuing key.

547 Consequence:

548 1. Same as [T-1.4.6]

549 Mitigations:

550 1. Same as [T-1.4.6]

551 [T-4.1.2]

552 FIDO Authenticator manufacturer relies on hardware or software components
553 that generate weak cryptographic authentication key material or contain back-
554 doors

555 Consequences:

556 1. Effective violation of [SA-1] in the context of such an Authenticator.

557 Mitigations:

558 1. The process of [SM-9] **Authenticator Certification** may reveal a subset of such
559 threats, but it is not possible that all such can be revealed with black box testing
560 and white box examination may be economically infeasible. Users and Relying
561 Parties with special concerns about this class of threat must exercise their own
562 necessary caution about the trustworthiness and verifiability of their vendors and
563 supply chain.

564 6.4.2 Threats to FIDO Server Vendors

565 [T-4.2.1]

566 Attacker adds malicious trust anchors to the trust list shipped by a FIDO Server
567 vendor.

568 Consequence:

- 569 1. Attacker can deploy fake Authenticators which Relying Parties cannot detect as
570 such, which do not implement any appropriate security measures, and is able to
571 violate all security goals of FIDO.

572 Mitigations:

- 573 1. This type of supply chain threat is outside the strict scope of the FIDO protocols
574 and violates [SA-7]. Relying Parties can verify their trust list against definitive
575 data published by the FIDO Alliance.

576 6.5 Threats Specific to UAF with a second factor / U2F

577 [T-1.5.1]

578 Relying parties issues an authentication challenge to an authenticator and can in-
579 fer from error status if it is already enrolled.

580 Consequences:

- 581 1. U2F authenticators not requiring user interaction may be used to track users
582 without their consent by issuing a pre-authentication challenge to a U2F token,
583 revealing the identity of an otherwise anonymous user. Users would be identifi-
584 able by relying parties without their knowledge, violating [SG-7]

585 Mitigations:

- 586 1. The U2F specification recommends that browsers prompt users whether to allow
587 this operation using mechanisms similar to those defined for other privacy sensi-
588 tive operations like Geolocation.

589 [T-1.5.2]

590 Malicious relying party mounts a cryptographic attack on a key handle it is stor-
591 ing.

592 Consequences:

- 593 1. U2F does not have a protocol-level notion of [SG-14] **Transaction Non-Repudi-**
594 **ation** but If the Relying Party is able to recover the contents of the key handle it

595 might forge logs of protocol exchanges to associate the user with actions he or
596 she did not perform.

597 2. If the Relying Party is able to recover the key used to wrap a key handle, that key
598 is likely shared, and might be used to decrypt key handles stored with other Rely-
599 ing Parties and violate [SG-1] **Strong User Authentication**.

600 Mitigations:

601 1. None. U2F depends on [SA-1] to hold for key wrapping operations.

602 [T-1.5.5]

603 Attacker gains physical access to U2F Authenticator (e.g., by stealing it).

604 Consequence:

605 1. Same as for T-1.4.4

606 2. A U2F authenticator has weak local user verification. If the attacker can guess
607 the username and password/PIN, they can impersonate the user, violating [SG-1]
608 **Strong User Authentication**

609 Mitigations:

610 1. Relying Parties can use strong additional factors.

611 2. Relying Parties should provide users a means to revoke keys associated with a
612 lost device.
