

1 **UAF Registry of Predefined** 2 **Values**

3 **Specification Set: fido-uaf-v1.0-rd-20140209 REVIEW DRAFT**

4 **Editors:**

5 Rolf Lindeman, Nok Nok Labs

6 Davit Baghdasaryan, Nok Nok Labs

7 Brad Hill, PayPal

8 **Contributors:**

9 **Abstract:**

10 This document defines all the strings and constants reserved by UAF protocols. The
11 values defined in this document are referenced by various UAF specifications.

12 **Status:**

13 This Specification has been prepared by FIDO Alliance, Inc. **This is a Review Draft Specification and is not intended to be a basis for any implementations as the Specification may**
14 **change.** Permission is hereby granted to use the Specification solely for the purpose of review-
15 ing the Specification. No rights are granted to prepare derivative works of this Specification. En-
16 tities seeking permission to reproduce portions of this Specification for other uses must contact
17 the FIDO Alliance to determine whether an appropriate license for such use is available.
18

19 Implementation of certain elements of this Specification may require licenses under third party
20 intellectual property rights, including without limitation, patent rights. The FIDO Alliance, Inc.
21 and its Members and any other contributors to the Specification are not, and shall not be held, re-
22 sponsible in any manner for identifying or failing to identify any or all such third party intellec-
23 tual property rights.

24 THIS FIDO ALLIANCE SPECIFICATION IS PROVIDED “AS IS” AND WITHOUT ANY
25 WARRANTY OF ANY KIND, INCLUDING, WITHOUT LIMITATION, ANY EXPRESS OR
26 IMPLIED WARRANTY OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS
27 FOR A PARTICULAR PURPOSE.

29 **1 Terminology**

30 Type names, attribute names and element names are written in *italics*.

31 String literals are enclosed in “”, e.g. “UAFV1-TLV”.

32 In formulas we use “|” to denote byte wise concatenation operations.

33 UAF specific terminology used in this document is defined in [FIDOGlossary].

34 **1.1 Key Words**

35 The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”,
36 “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this doc-
37 ument are to be interpreted as described in [RFC2119].

38 2 Introduction

39 This document defines the registry of UAF-specific constants that are used and refer-
40 enced in various UAF specifications. It is expected that, over time, new constants will be
41 added to this registry. For example new authentication algorithms and new types of au-
42 thenticator characteristics will require new constants to be defined for use within the
43 specifications.

44 **3 Authenticator Characteristics**

45 **3.1 Authentication Factors**

46 The USER_VERIFY constants are flags in a bitfield represented as a 64 bit long integer.
47 They describe the methods and capabilities of an UAF authenticator for locally verifying
48 a user. In most cases, the operational details of these methods are opaque to the
49 server, but in some cases verification may involve transmission of attested measure-
50 ment, such as for USER_VERIFY_LOCATION. These constants are used in the au-
51 thoritative metadata for an authenticator, reported and queried through the UAF Discov-
52 ery APIs, and used to form Authenticator policies in UAF protocol messages.

| | | |
|----|---|------|
| 53 | USER_VERIFY_PRESENCE | 0x01 |
| 54 | This flag will be set if the authenticator is able to confirm user presence in any | |
| 55 | fashion. If this flag and no other is set for user verification, the guarantee is | |
| 56 | only that the authenticator cannot be operated without some human interven- | |
| 57 | tion, not necessarily that the presence verification provides any level of au- | |
| 58 | thentication of the human's identity. (e.g. a device that requires a touch to acti- | |
| 59 | vate) | |
| 60 | USER_VERIFY_FINGERPRINT | 0x02 |
| 61 | This flag will be set if the authenticator uses any type of measurement of a fin- | |
| 62 | gerprint for User-to-Authenticator authentication. | |
| 63 | USER_VERIFY_PASSCODE | 0x04 |
| 64 | This flag will be set if the authenticator uses a local-only passcode for User-to- | |
| 65 | Authenticator authentication. | |
| 66 | USER_VERIFY_VOICEPRINT | 0x08 |
| 67 | This flag will be set if the authenticator uses a voiceprint for User-to-Authenti- | |
| 68 | cator authentication. | |
| 69 | USER_VERIFY_FACEPRINT | 0x10 |
| 70 | This flag will be set if the authenticator uses any manner of face recognition to | |
| 71 | locally authenticate the user. | |
| 72 | USER_VERIFY_LOCATION | 0x20 |

FIDO UAF Registry of Predefined Values

73 This flag will be set if the authenticator uses any form of location sensor or
74 measurement for User-to-Authenticator authentication and/or returns a loca-
75 tion measurement to the Relying Party as an additional user verification.

76 **USER_VERIFY_EYEPRINT** 0x40

77 This flag will be set if the authenticator uses any form of eye biometrics for
78 User-to-Authenticator authentication.

79 **USER_VERIFY_PATTERN** 0x80

80 This flag will be set if the authenticator uses a drawn pattern for User-to-Au-
81 thenticator authentication.

82 **USER_VERIFY_HANDPRINT** 0x100

83 This flag will be set if the authenticator uses any measurement of a full hand
84 (including palm-print, hand geometry or vein geometry) for User-to-Authentica-
85 tor authentication.

86 **USER_VERIFY_NONE** 0x200

87 This flag will be set if the authenticator will respond without any user interac-
88 tion.

89 **3.2 Key Protection Types**

90 The KEY_PROTECTION constants are flags in a bit field represented as a 64 bit long
91 integer. They describe the method an authenticator uses to protect the private key ma-
92 terial for FIDO registrations. These constants are used in the authoritative metadata for
93 an authenticator, reported and queried through the UAF Discovery APIs, and used to
94 form Authenticator policies in UAF protocol messages. When used in metadata de-
95 scribing an authenticator, several of these flags are exclusive with others - the certified
96 metadata may have at most one of the mutually exclusive bits set to 1. When used in
97 authenticator policy, any bit may be set to 1, e.g. to indicate that a server is willing to ac-
98 cept authenticators using either KEY_PROTECTION_SOFTWARE and KEY_PROTEC-
99 TION_HARDWARE.

100 **KEY_PROTECTION_SOFTWARE** 0x01

FIDO UAF Registry of Predefined Values

101 This flag will be set if the authenticator uses software-based key manage-
102 ment.

103 *Exclusive in authenticator metadata with KEY_PROTECTION_HARD-*
104 *WARE, KEY_PROTECTION_TEE, KEY_PROTECTION_SECURE_ELE-*
105 *MENT*

106 KEY_PROTECTION_HARDWARE 0x02

107 This flag will be set if the authenticator uses hardware-based key manage-
108 ment.

109 *Exclusive in authenticator metadata with KEY_PROTECTION_SOFT-*
110 *WARE*

111 KEY_PROTECTION_TEE 0x04

112 This flag will be set if the authenticator uses the Trusted Execution Envi-
113 ronment [TEE] for key management. In authenticator metadata, this flag
114 should be set in conjunction with KEY_PROTECTION_HARDWARE.

115 *Exclusive in authenticator metadata with KEY_PROTECTION_SOFT-*
116 *WARE, KEY_PROTECTION_SECURE_ELEMENT*

117 KEY_PROTECTION_SECURE_ELEMENT 0x08

118 This flag will be set if the authenticator uses a Secure Element [SecureEle-
119 ment] for key management. In authenticator metadata, this flag should be
120 set in conjunction with KEY_PROTECTION_HARDWARE.

121 *Exclusive in authenticator metadata with KEY_PROTECTION_TEE,*
122 *KEY_PROTECTION_SOFTWARE*

123 KEY_PROTECTION_REMOTE_HANDLE 0x10

124 This flag will be set if the authenticator does not store per-Origin keys at
125 the client, but relies on a server-provided key handle.

126 This flag **MUST** be set in conjunction with one of the other `KEY_PROTEC-`
127 `TION` flags to indicate how the local key handle wrapping key and opera-
128 tions are protected.

129 Servers can unset this flag in authenticator policy if they are unprepared to
130 store and return key handles, for example, if they have a requirement to
131 respond indistinguishably to authentication attempts against userIDs that
132 do and do not exist. Refer to [UAFProtocol] for more details.

133 3.3 Authenticator Attachment Hints

134 The `ATTACHMENT_HINT` constants are flags in a bit field represented as a 64 bit long.
135 They describe the method an authenticator uses to communicate with the system on
136 which the FIDO client software is executing. These constants are reported and queried
137 through the UAF Discovery APIs, and used to form Authenticator policies in UAF proto-
138 col messages.

139 Because the connection state and topology of an authenticator may be transient, these
140 values are only hints that can be used by server-supplied policy to guide the user expe-
141 rience, e.g. to prefer a device that is connected and ready for authenticating or confirm-
142 ing a low-value transaction, rather than one that is more secure but requires more user
143 effort. These values are not reflected in authenticator metadata and cannot be relied on
144 by the relying party, although some models of authenticator may provide attested mea-
145 surements of similar data as part of UAF response messages.

| | | |
|-----|---|------|
| 146 | <code>ATTACHMENT_HINT_INTERNAL</code> | 0x01 |
| 147 | This flag indicates that the authenticator is permanently attached to the | |
| 148 | system on which the FIDO client software is running. | |

FIDO UAF Registry of Predefined Values

149 A device such as a smartphone may have authenticator functionality that is
150 able to be used both locally and remotely. In such a case, the FIDO client
151 MUST filter and exclusively report only the relevant bit during Discovery
152 and when performing policy matching.

153 ATTACHMENT_HINT_EXTERNAL 0x02
154 This flag indicates, for a hardware-based authenticator, that it is removable
155 or remote from the system on which the FIDO client software is running.

156 A device such as a smartphone may have authenticator functionality that is
157 able to be used both locally and remotely. In such a case, the FIDO client
158 MUST filter and exclusively report only the relevant bit during Discovery
159 and when performing policy matching.

160 ATTACHMENT_HINT_WIRED 0x04
161 Indicates that an external authenticator currently has an exclusive wired
162 connection, e.g. through USB, Firewire or similar, to the system on which
163 the FIDO client software is executing.

164 ATTACHMENT_HINT_WIRELESS 0x08
165 Indicates that an external authenticator communicates with the system on
166 which the FIDO client software is executing through a personal area or
167 otherwise non-routed wireless protocol, such as Bluetooth or NFC.

168 ATTACHMENT_HINT_NFC 0x10
169 Indicates that an external authenticator is able to communicate by NFC to
170 the FIDO client software. As part of authenticator metadata, or when re-
171 porting characteristics through Discovery, if this flag is set, the ATTACH-
172 MENT_HINT_WIRELESS flag SHOULD also be set.

173 ATTACHMENT_HINT_BLUETOOTH 0x20
174 Indicates that an external authenticator is able to communicate using Blue-
175 tooth to the FIDO client software. As part of authenticator metadata, or

176 when reporting characteristics through Discovery, if this flag is set, the AT-
177 TACHMENT_HINT_WIRELESS flag SHOULD also be set.

178 ATTACHMENT_HINT_NETWORK 0x40
179 Indicates that the authenticator is not on the same system as the FIDO
180 client software but communicates with it over a non-exclusive network.
181 (e.g. over a TCP/IP LAN or WAN, as opposed to a point-to-point Bluetooth
182 connection)

183 ATTACHMENT_HINT_READY 0x80
184 Indicates that an external authenticator is in a ready state. e.g. a Bluetooth
185 connected device that is currently paired and connected or a USB device
186 that is plugged in.

187 3.4 Secure Display Types

188 The SECURE_DISPLAY constants are flags in a bit field represented as a 64 bit long
189 integer. They describe the availability and implementation of a secure display capability
190 required for the Transaction Confirmation operation. These constants are used in the
191 authoritative metadata for an authenticator, reported and queried through the UAF Dis-
192covery APIs, and used to form Authenticator policies in UAF protocol messages.

193 SECURE_DISPLAY_ANY 0x01
194 This flag indicates, that some form of secure display is available on this
195 authenticator.

196 SECURE_DISPLAY_PRIVILEGED_SOFTWARE 0x02
197 This flag indicates, that a software-based secure display operating in a
198 privileged context is available on this authenticator.

FIDO UAF Registry of Predefined Values

- 199 Software based displays are typically provided by the FIDO client software
200 rather than the authenticator itself. A FIDO client that is capable of provid-
201 ing this capability MAY set this bit for all authenticators of type ATTACH-
202 MENT_EMBEDDED, even if the authoritative metadata for the authentica-
203 tor does not indicate this capability.
- 204 **SECURE_DISPLAY_TEE** 0x04
205 This flag indicates that the authenticator implements a secure display in the
206 Trusted Execution Environment [TEE].
- 207 **SECURE_DISPLAY_HARDWARE** 0x08
208 This flag indicates, that a secure display based on hardware assisted ca-
209 pabilities is available on this authenticator.
- 210 **SECURE_DISPLAY_REMOTE** 0x10
211 This flag indicates, that the secure display is provided on a distinct device
212 from the system the FIDO client software is executing on.

213 4 Predefined Tags

214 The internal structure of UAF authenticator commands is a “Tag-Length-Value” (TLV)
215 sequence. The **Tag** is a 2-byte unique unsigned value describing the type of field the
216 data represents, the **Length** is a 2-byte unsigned value indicating the size of the value
217 in bytes and **Value** is the variable-sized series of bytes which contain data for this item
218 in the sequence.

219 Note that Tags are not used as bitflags.

220 4.1 Tags used in the protocol

221 The following tags have been allocated for data types in UAF protocol messages:

| | | |
|-----|---|------|
| 222 | TAG_UAFV1_REG_RESPONSE | 0x01 |
| 223 | The content of this TAG is Authenticator Response for Register command. | |
| 224 | TAG_UAFV1_SIGN_RESPONSE | 0x02 |
| 225 | The content of this TAG is Authenticator Response for Sign command. | |
| 226 | TAG_UAFV1_KRD | 0x03 |
| 227 | Indicates Key Registration Data. | |
| 228 | TAG_UAFV1_SIGNEDDATA | 0x04 |
| 229 | Indicates data signed by authenticator using Uauth.priv key. | |
| 230 | TAG_ATTESTATION_CERT | 0x05 |
| 231 | Indicates DER encoded Attestation Batch Certificate. | |
| 232 | TAG_SIGNATURE | 0x06 |
| 233 | Indicates a cryptographic signature. | |

234 4.2 Tags for crypto algorithms and types

235 These TAGs indicate the specific authentication algorithms, public key formats and
236 other crypto relevant data.

237 4.3 Authentication Algorithms

- 238 UAF_ALG_SIGN_ECDSA_SHA256_RAW 0x01
239 ECDSA signature MUST have raw R and S buffers, encoded in big-endian
240 order.
241 For example for ECC-P256 curve the signature MUST have the following
242 form
243 [R (32 bytes), S (32 bytes)]
- 244 UAF_ALG_SIGN_ECDSA_SHA256_DER 0x02
245 DER encoded ECDSA signature,
246 i.e. DER encoded SEQUENCE { r INTEGER, s INTEGER }
- 247 UAF_ALG_SIGN_RSASSA-PSS_SHA256_RAW 0x03
248 RSASSA-PSS signature MUST have raw S buffers, encoded in big-endian
249 order. For example for RSA 2048 the signature have the following form [S
250 (256 bytes)]
- 251 UAF_ALG_SIGN_RSASSA-PSS_SHA256_DER 0x04
252 DER encoded RSASSA-PSS signature

253 4.4 Public Key Representation Formats

254 UAF_ALG_KEY_ECC_NISTP256R1_X962_RAW 0x100

255 Raw ANSI X.9.62 formatted public key

256 UAF_ALG_KEY_ECC_NISTP256R1_X962_DER 0x101

257 DER encoded ANSI X.9.62 formatted public key

258 UAF_ALG_KEY_RSA_2048_PSS_RAW 0x102

259 Raw RSASSA-PSS formatted public key

260

261 UAF_ALG_KEY_RSA_2048_PSS_DER 0x103

262 ASN.1 DER encoded RSASSA-PSS formatted public key

263 **5 Assertion Schemes**

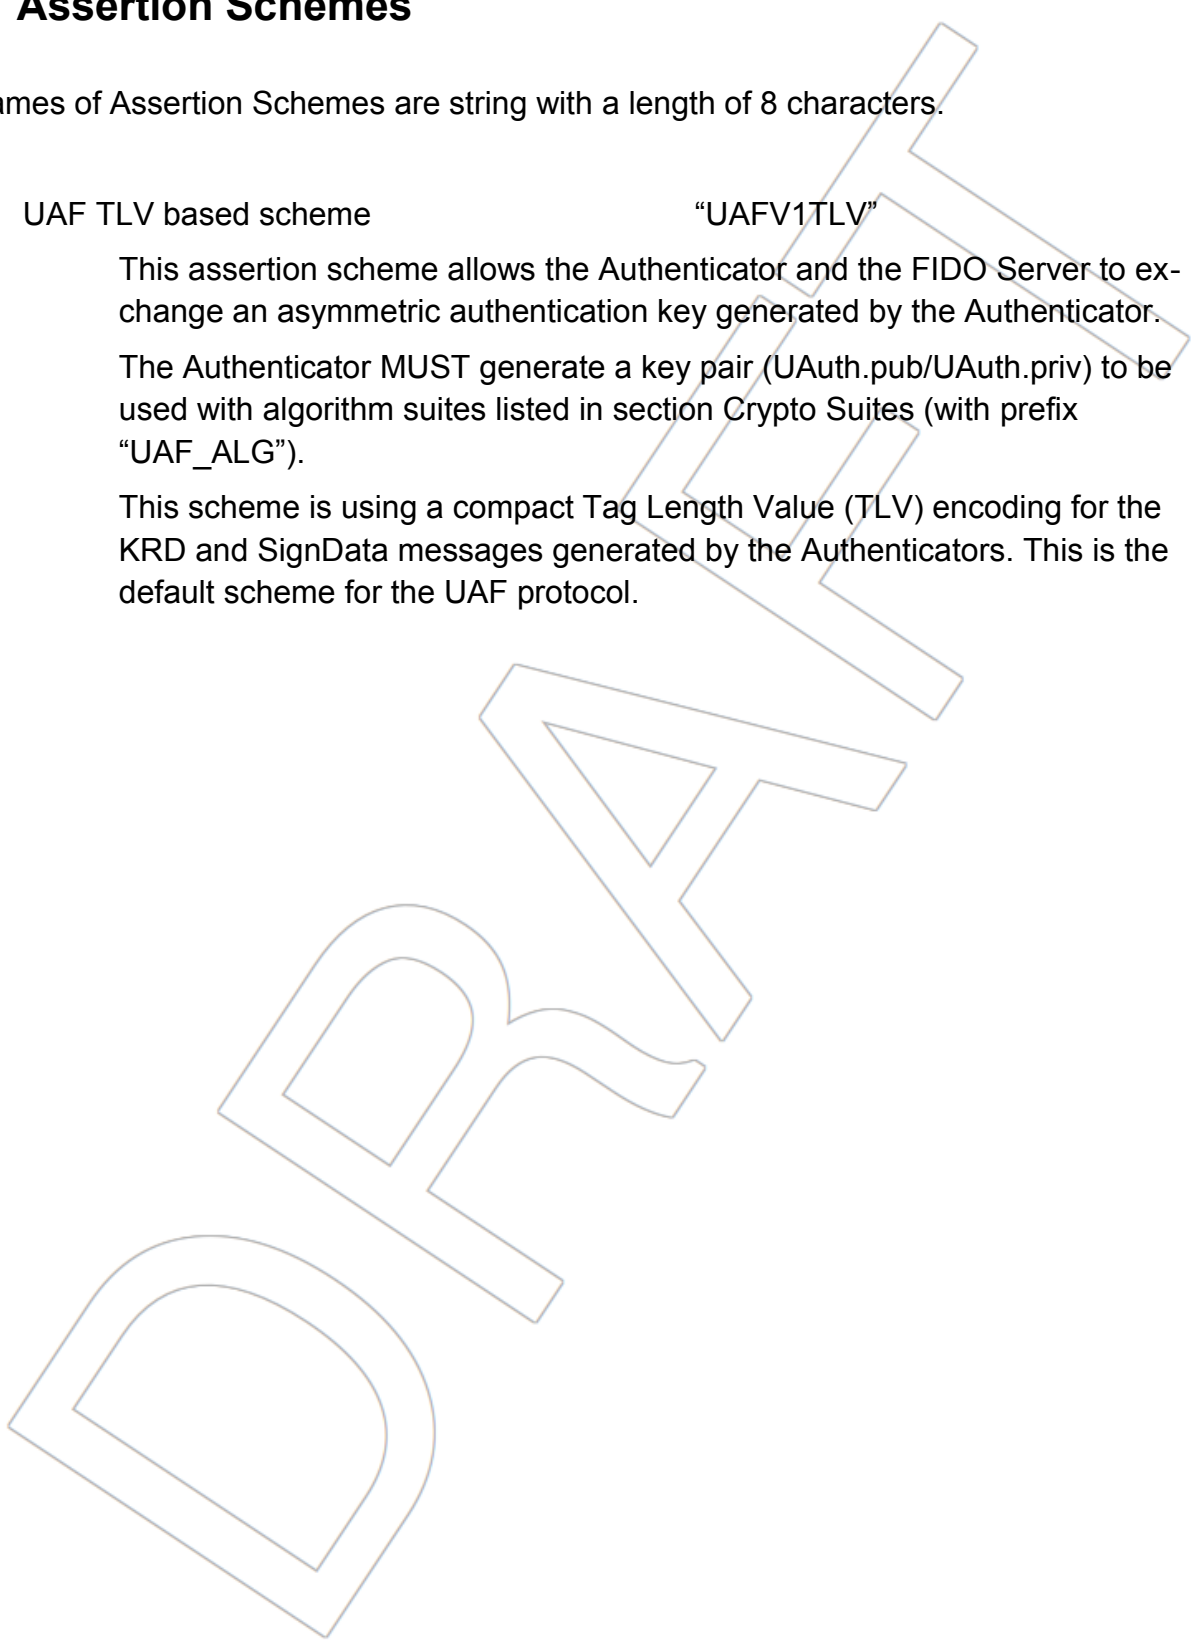

264 Names of Assertion Schemes are string with a length of 8 characters.

265 UAF TLV based scheme "UAFV1TLV"

266 This assertion scheme allows the Authenticator and the FIDO Server to ex-
267 change an asymmetric authentication key generated by the Authenticator.

268 The Authenticator **MUST** generate a key pair (UAuth.pub/UAuth.priv) to be
269 used with algorithm suites listed in section Crypto Suites (with prefix
270 "UAF_ALG").

271 This scheme is using a compact Tag Length Value (TLV) encoding for the
272 KRD and SignData messages generated by the Authenticators. This is the
273 default scheme for the UAF protocol.
